

Technology Stack

Date	29 September 2026
Team ID	SWTID-2026-1410
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders With Flow Designer
Maximum Marks	2 Marks

Define Your Technology Stack:

Identify the programming languages, frameworks, databases, front-end tools, back-end tools, and APIs that you will use to build your solution. A well-chosen technology stack ensures that your application is scalable, maintainable, and aligned with your project requirements.

Fill out the table below to detail the specific technologies chosen for each component of your architecture and provide a brief justification for your choice.

Technology Stack Details

S.No	Architecture Component / Layer	Technology Chosen	Justification / Purpose
1	Frontend / Client-Side	ServiceNow Service Catalog (catalog item form)	Ready-made ordering page where the employee finds Standard Laptop under Hardware, ticks optional software and clicks Order Now. No separate front end is needed.
2	Backend / Server-Side	ServiceNow Flow Designer (Workflow Studio): Service Catalog trigger and Create Catalog Task action	Low-code automation that runs on the server when an order is placed and creates the fulfillment task. It is visual and needs no scripting.
3	Database / Data Storage	ServiceNow platform tables: Catalog Item, Request, Requested Item and Catalog Task [sc_task]	Built-in relational storage for the catalog item, the order and the fulfillment task, so no external database is needed.
4	Cloud / Hosting / Deployment	ServiceNow Personal Developer Instance (cloud)	Hosted by ServiceNow, so no server setup is required. Free developer instance is enough to build and test the project.
5	Version Control & CI/CD	GitHub	Keeps all project deliverables and screenshots organized and shareable with the team.
6	Third-Party APIs / Other Tools	None (built-in ServiceNow Maintain Items and Workflow Studio modules)	The solution uses only the platform's own modules, so no external API or tool is required.
